1.

$P: \nexists N \in \mathbb{N} \ |F| = n$
Suppose F is Finite

(1) $TP: \exists N \in \mathbb{N} \ |F| = n$ Premise $\forall i \in (1, 2, \dots, n-2)$

(2) $F = \{f_1, f_2, \dots, f_n\}, f_i + f_{i+1} = f_{i+2}$

Definition

(3) $f_{n-1}, f_n \in F$ Definition

(4) $f_{n-1} + f_n \in F$

(5) $f_{n-1} + f_n \neq f_i, \forall i \in \{1, 2, \dots, n-3\}$ and $f_{n-1} + f_n \in F$

-0.5

You need a couple more steps to flush this problem out

This is contradictory, then supposition is false
Therefore f is infinite.

2. Square of an integer must be even
so integer must be even.

$$P: x \in \mathbb{N}, x^2 \in \mathbb{Z}_E, x \in \mathbb{Z}_E$$

Proof

$$\neg P: x \in \mathbb{N}, x^2 \notin \mathbb{Z}_E, x \in \mathbb{Z}_O \text{ Premise}$$

(I) let $a \in \mathbb{N}$ Definition

(II) let $x = 2a + 1$ Definition of odd ✓

(III) $x^2 = (2a + 1)^2$ Algebra

$$x^2 = 4a^2 + 4a + 1 \text{ Definition of odd}$$

Thus if x is odd so is x^2

\therefore Thus if x is even x^2 is even $\neg P \rightarrow \text{False}$

(2)

Contradiction proofs require two contradicting pieces of evidence; you need to show x^2 is and isn't even

Prove by Induction

3. $P: \forall n \in \mathbb{N}, \exists m \in \mathbb{N}, n^3 + 2n = 3m$

Step 1:

$P: \sum_{i=1}^m i^3 + 2i = 3m$ Let $m=1$

(I) $\sum_{i=1}^m i^3 + 2i$ Premise

(II) $\sum_{i=1}^1 i^3 + 2i$ Sub 1 = m

(III) 3 definition of sub Σ

(IV) 3.1 Math

(V) $3m$ Substitute $m=1$

Conclusion

Steps (I) - (V) show that P is true for $m=1$

Step 2: Induction Hypothesis

Let $m=k$ assume

$\sum_{i=1}^k (i^3 + 2i) = 3k$

Step 3: Induction step

$P: \sum_{i=1}^m (i^3 + 2i) = 3m$ for $m=k+1$ $\sum_{i=1}^k (i^3 + 2i) = 3k$

(I) $\sum_{i=1}^m (i^3 + 2i)$ Premise

(II) $\sum_{i=1}^{k+1} (i^3 + 2i)$ Substitution $m=k+1$

$$k^3 + 3k + 1 + 2k + 2$$

(III) $\sum_{i=1}^k (i^3 + 2i) + (1(k+1)^3 + 2 \cdot (k+1))$
def of Σ

(IV) $k^3 + 3k + k^3 + 1 + 2k + 2$ Induction Hypothesis

$$k^3 + 6k + 2k + 3$$

$$k^3 + 8k + 3$$

$m = k+1$ False

$$b \pm \sqrt{4ac - b^2}$$

$$\frac{64 \pm \sqrt{12 - 64}}{2}$$

IS

This is true; you should be able to get it back into the form $3m$

Step 4 ✓

Although base case is true,
the induction did Not pass
because $m \neq k+1$, thus
IP is false for all $N \in \mathbb{N}$ and
 $m \in \mathbb{N}$

Prove by induction

$$4. IP: \forall n \in \mathbb{N}, a \neq 1, a^0 + a^1 + \dots + a^n = \frac{a^{n+1} - 1}{a - 1}$$

$$\text{Let } a = 2$$

$$\text{Let } n = 1$$

$$IP: \forall n \in \mathbb{N}, a \neq 1, \sum_{i=1}^n a^i = \frac{a^{i+1} - 1}{a - 1}$$

$$(I) \sum_{i=1}^n (2^i) \quad \text{Premise}$$

$$(II) \sum_{i=1}^1 (2^i)$$

$$\text{Sub } n = 1$$

$$(III) 2^1 = 2$$

def of substitution

$$(IV) = \frac{2^{1+1} - 1}{2 - 1} \quad \text{substitute } i = n$$

$$(V) \frac{2^2 - 1}{2 - 1} = \frac{4 - 1}{1} = 3 \quad \text{Math}$$

Conclusion: Steps (I)-(V) proves that IP is not true for $n = 1$.
True induction fails

-4

This is true; it should've been $2^0 + 2^1$ which is 3, thus showing the basis case is true. See myself or Dr. Kandel for guidance on this problem
